CO5 ASSESSMENT TOOL 1 – Research Paper Review / Literature Survey

Course Code:	CSA1003	Course Title:	Software Engineering
CO Assessed:	CO5	Assessment:	Assessment Tool 1 – Research Paper Review / Literature Survey
Weightage:	20%	Total Marks:	25
CO5 Statement:	Evaluate emerging technologies and societal impacts, maintaining and evolving software systems responsibly		
Student Name:	Krishna Tejesh Reddy.Y	Reg. No.:	192411200
Date:	26-8-2026	Duration:	60 minutes

Code of Conduct

I __ Krishna Tejesh Reddy .Y(192411200) _ (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: _____

Annexure A – Research Paper Review / Literature Survey

1. Introduction

Campus placement is an important process through which educational institutions connect students with organizations offering employment opportunities. Traditional placement activities often involve manual collection of student information, eligibility verification, resume screening, job matching, interview scheduling, and maintaining placement records.

A Campus Placements and Recruitment Portal can centralize these activities into a single software platform. Such a system can provide student registration, profile management, resume submission, job discovery, eligibility checking, applications, recruiter interaction, candidate shortlisting, interview scheduling, selection tracking, and placement reports.

Recent research has increasingly explored the use of machine learning, recommendation systems, natural language processing, knowledge graphs, and AI-based candidate matching to improve recruitment systems. For example, research has investigated student-profile-based job recommendation, machine-learning-based placement prediction, dynamic job recommendation, and AI-assisted candidate filtering.

This literature survey reviews existing research related to intelligent campus recruitment and job recommendation systems, compares their methodologies and technologies, identifies their limitations, and derives research gaps that can guide the development of an improved Campus Placements and Recruitment Portal.

2. Objectives of the Literature Survey

The objectives of this literature survey are:

1. To study existing campus placement and recruitment systems.
2. To analyze machine-learning approaches used in placement prediction.
3. To study recommendation techniques used for matching students with jobs.
4. To examine AI-based candidate screening and recruitment approaches.
5. To compare methodologies, tools, datasets, and findings of existing studies.
6. To identify limitations of current recruitment systems.
7. To identify research gaps related to campus placement portals.
8. To propose future improvements for an intelligent and reliable placement platform.

3. Research Papers Selected for Review

The following research papers are selected because they directly relate to campus recruitment, student job recommendation, employment recommendation, and AI-based candidate matching.

No.	Research Paper	Year
1	A Hierarchical Similarity Based Job Recommendation Service Framework for University Students	2017
2	Beyond Accuracy Optimization: On the Value of Item Embeddings for Student Job Recommendations	2017
3	A Study of Reciprocal Job Recommendation for College Graduates Integrating Semantic Keyword Matching and Social Networking	2023
4	Campus Recruitment System using Machine Learning	2025
5	A Comprehensive Review of Campus Recruitment Systems Using Machine Learning	2025
6	Dynamic Job Recommendation by Profiling Undergraduates Academic Performances	2025
7	A Unified AI-Powered Resume Generation and ML-Based Candidate Filtering Framework for Smart Campus Recruitment	2026
8	A Knowledge Graph-Integrated Recommendation Method for College Student Career Planning	2026

These papers cover different approaches, including similarity-based recommendation, neural embeddings, semantic matching, machine learning, dynamic recommendation, resume filtering, and knowledge graphs.

4. Review of Research Paper 1

A Hierarchical Similarity Based Job Recommendation Service Framework for University Students

Authors: Rui Liu, Wenge Rong, Yuanxin Ouyang, Zhang Xiong
Year: 2017

Research ProblemUniversity students often have difficulty selecting suitable jobs because they generally have limited work experience and may not be familiar with the employment market. The large number of available job opportunities also creates information overload.

Methodology

The research proposes a **student-profiling-based re-ranking framework** for recommending jobs. Student profiles are compared with historical recruitment information, including students who graduated and obtained job offers.

Recommended employers are also considered when re-ranking job recommendations.

Dataset

The research used **real recruitment data collected over four years**.

Key Findings

The study demonstrated the potential of using student profiles and historical recruitment information to improve job recommendations for university students.

Limitations

- Historical recruitment data may become outdated.
- Student preferences can change over time.
- Similarity-based approaches may not fully understand semantic relationships between skills and job descriptions.
- Recommendations depend heavily on the quality of historical recruitment data.

Relevance to Our Project

The approach can be used in the Campus Placements and Recruitment Portal to recommend jobs based on student academic profiles and previous placement patterns.

5. Review of Research Paper 2

Beyond Accuracy Optimization: On the Value of Item Embeddings for Student Job Recommendations

Authors: Emanuel Lacic, Dominik Kowald, Markus Reiter-Haas, Valentin Slawicek, Elisabeth Lex

Year: 2017

Research Problem

The research investigates how jobs can be recommended to university students using more advanced representation techniques rather than relying only on traditional recommendation accuracy.

Methodology

The study uses **neural item embeddings** for content-based job recommendation. It also considers the frequency and recency of student interactions with job postings.

Dataset

The researchers evaluated their approach using data from the **Studo student job portal in Austria**.

Evaluation

The recommendation system was evaluated using:

- Prediction accuracy
- Diversity
- Novelty

Key Findings

The research showed that incorporating interaction frequency and recency into item embeddings can improve the robustness of job recommendations with respect to accuracy and diversity.

Limitations

- Requires sufficient interaction data.
- New students may have limited historical interactions.
- More complex models may require greater computational resources.
- Recommendation quality depends on the available job-interaction dataset.

Relevance

This approach can help the proposed portal recommend jobs based not only on student qualifications but also on their interaction history.

6. Review of Research Paper 3

A Study of Reciprocal Job Recommendation for College Graduates Integrating Semantic Keyword Matching and Social Networking

Authors: Jinping Yao, Yunhong Xu, Jiaojiao Gao
Year: 2023

Research Problem

College graduates face difficulties in finding suitable jobs because the employment market contains a large number of candidates and job opportunities. The research also considers the **cold-start problem**, where graduates have limited employment history.

Methodology

The research integrates:

- Semantic keyword matching
- Job recommendation
- Social-networking information

The goal is to improve reciprocal matching between graduates and employment opportunities.

Key Issue

The study identifies the lack of historical employment data for college graduates as an important challenge in recommendation systems.

Limitations

- New users still create a cold-start challenge.
- Social information may not always be available.
- Privacy concerns can arise when using additional personal information.
- Semantic matching may require continuous improvement as job terminology changes.

Relevance

7. Review of Research Paper 4

Campus Recruitment System using Machine Learning

Authors: J. N. Ekatpure, Sneha Dhanaji Mohite, Akanksha Ankush Shinde, Nikita Bibhishan Shirkande,
Vaishnavi Vikram Upase

Year: 2025

Research Problem

The research focuses on using machine learning and artificial intelligence to improve campus recruitment.

Methodology

The study investigates the use of machine learning in campus recruitment and discusses the changing role of placement as part of higher education and employment.

Technologies

- Machine Learning
- Artificial Intelligence
- Talent Acquisition

Key Findings

The study emphasizes the importance of technology-driven campus recruitment as employment and recruitment processes become increasingly data-oriented.

Limitations

The paper provides a relatively high-level treatment of machine-learning-based campus recruitment, leaving opportunities for deeper implementation and evaluation of integrated recruitment workflows.

Relevance

It supports the idea of incorporating ML capabilities into a centralized campus recruitment platform.

8. Review of Research Paper 5

A Comprehensive Review of Campus Recruitment Systems Using Machine Learning

Authors: Jalindar Nivrutti, Mohite Sneha Dhanaji, Shinde Akanksha Ankush, Shirkande Nikita Bibhishan, Upase Vaishnavi Vikram

Year: 2025

Research Problem

Traditional recruitment systems can require substantial manual effort and may not effectively match student capabilities with job requirements.

Methodology

This research provides a review of ML-based campus recruitment approaches.

The areas discussed include:

- Predictive candidate selection
- Resume screening
- Job matching
- Interview performance analysis
- NLP
- AI chatbots

Findings

The research identifies ML as a way to improve recruitment efficiency and decision-making. It also highlights important challenges including:

- Data privacy
- Algorithmic bias
- Requirement for large datasets
- NLP-related challenges

The study identifies emerging possibilities such as AI-powered chatbots and NLP-based resume understanding.

Limitations

- Large datasets may be required.
- ML systems can inherit bias from historical recruitment data.
- Privacy is important when processing student information.
- AI recommendations require human oversight.

Relevance

This paper is highly relevant to the proposed portal because it identifies several intelligent features that can be integrated into campus recruitment.

9. Review of Research Paper 6

Dynamic Job Recommendation by Profiling Undergraduates Academic Performances

Authors: Bao-Ling Foo, Choo-Yee Ting, Hui-Ngo Goh, Albert Quek, Chin-Leei Cham

Year: 2025

Research Problem

Traditional job recommendation may require considerable human intervention and may not effectively prioritize suitable jobs and companies for students.

Methodology

The research focuses on:

- Identifying important student features
- Predicting suitable job sectors
- Recommending companies
- Comparing student and job profiles

The study investigates machine-learning techniques including **Transformers, Random Forest, Categorical Boosting, classification, and hybrid filtering.**

Key Findings

The research proposes dynamically recommending relevant job sectors and companies based on undergraduate profiles.

Limitations

- Models require high-quality student data.
- Dynamic recommendations require continuously updated job information.
- Complex models may reduce interpretability.
- Ethical considerations are important when recommendations influence employment opportunities.

Relevance

This is one of the most directly relevant papers for the proposed Campus Placements and Recruitment Portal because it supports personalized job and company recommendations.

10. Review of Research Paper 7

A Unified AI-Powered Resume Generation and ML-Based Candidate Filtering Framework for Smart Campus Recruitment

Year: 2026

Research Problem

Traditional campus recruitment includes manual resume creation, screening, feature evaluation, and candidate shortlisting. These activities can cause delays and inconsistencies.

Methodology

The paper proposes a unified framework combining:

- AI-powered resume generation
- Machine-learning-based candidate filtering

- Smart campus recruitment

Key Findings

The research attempts to reduce manual effort and improve consistency in the candidate screening process by combining resume-related AI capabilities with ML-based filtering.

Limitations

- AI-generated resumes require validation.
- Candidate filtering models may introduce bias.
- Training data quality directly affects model performance.
- Automated filtering should not completely replace human decision-making.

Relevance

The proposed Campus Placement Portal could include AI-assisted resume analysis while keeping final recruitment decisions under human control.

11. Review of Research Paper 8

A Knowledge Graph-Integrated Recommendation Method for College Student Career Planning

Authors: Xiaojun Xu, Hui Gao

Year: 2026

Research Problem

Career recommendations for college students must account for complex relationships between students, interests, skills, careers, and opportunities.

Methodology

The research introduces a **knowledge graph-integrated recommendation model** for college student career planning.

The knowledge graph provides enriched representations of career-related information.

Key Findings

The study reports improved recommendation accuracy compared with existing approaches across multiple datasets.

Limitations

- Knowledge graphs require considerable effort to construct and maintain.
- Career and skill information changes over time.
- The approach may be more complex than basic recommendation techniques.
- Real-world deployment requires continuously updated knowledge.

Relevance

A knowledge graph could be used in the Campus Placement Portal to connect:

Student → Skills → Courses → Job Roles → Companies → Career Paths

This could make recommendations more explainable and useful.

12. Comparative Literature Survey

Paper	Methodology	Dataset / Tools	Key Findings	Limitations	Research Gap
Liu et al. (2017)	Student profiling, similarity, re-ranking	4 years recruitment data	Useful job recommendations	Depends on historical data	Dynamic skill/job changes
Lacic et al. (2017)	Neural item embeddings	Studo student job portal	Improved accuracy, diversity and novelty	Needs interaction data	Cold-start and explainability
Yao et al. (2023)	Semantic matching + social information	Graduate/job data	Addresses reciprocal recommendation	Privacy and cold-start issues	Privacy-aware matching

Ekatpure et al. (2025)	ML-based recruitment	ML/AI	Supports intelligent campus recruitment	Limited integrated workflow	End-to-end implementation
Nivrutti et al. (2025)	ML review	ML, NLP, AI	Identifies ML recruitment applications	Bias, privacy, dataset requirements	Responsible AI
Foo et al. (2025)	Transformers, RF, CatBoost, hybrid filtering	Undergraduate profiles	Dynamic job/company recommendations	Model complexity	Explainable dynamic recommendations
Jadhav et al. (2025)	ML recommendations + dynamic skill updates	Industry skill data	Updates recommendations based on changing skills	Requires continuous data/model updates	Real-time adaptive system
Xu & Gao (2026)	Knowledge graph recommendation	Career knowledge graph	Improved career recommendation	Knowledge graph maintenance	Scalable real-world deployment
AI Resume/ML Filtering (2026)	AI resume generation + ML filtering	Recruitment profiles	Reduces manual screening	Bias and validation	Human-in-the-loop recruitment

The comparison shows a progression from **traditional similarity-based recommendation** toward **ML, semantic, dynamic, knowledge-graph, and AI-assisted approaches**.

13. Comparative Analysis

13.1 Methodology Comparison

Early approaches primarily use similarity-based recommendation and student profiling. Later systems introduce machine learning, neural embeddings, semantic matching, hybrid filtering, and knowledge graphs.

This indicates a shift from simple profile-to-job matching toward systems that attempt to understand more complex relationships between students, skills, job descriptions, employers, and career paths.

13.2 Technology Comparison

Technology	Main Purpose
Similarity Matching	Match student profiles with jobs
Collaborative Filtering	Use user/job interaction patterns
Neural Embeddings	Represent jobs and interactions
Random Forest	Classification/prediction
CatBoost	Classification
Transformers	Advanced feature/model representation
NLP	Understand resumes and job descriptions
Knowledge Graphs	Represent relationships between skills/jobs/careers
Hybrid Filtering	Combine multiple recommendation approaches

14. Critical Analysis of Existing Approaches

Although existing research demonstrates the potential of intelligent recruitment systems, several challenges remain.

14.1 Dependence on Historical Data

Many recommendation and prediction approaches rely on historical recruitment information. However, employment requirements change rapidly.

A model trained on old recruitment data may recommend skills or companies that are no longer aligned with current requirements.

14.2 Cold-Start Problem

New students may have little or no interaction history.

Similarly, newly registered companies and newly posted jobs may not have sufficient historical information.

This makes traditional recommendation approaches less effective for new users and items.

14.3 Algorithmic Bias

Recruitment models trained on historical hiring decisions can potentially reproduce existing biases.

Therefore, automated recommendations should be treated as decision-support rather than fully autonomous hiring decisions.

14.4 Data Privacy

A campus recruitment system may store:

- Academic records
- Resumes
- Contact information
- Skills
- Application history
- Interview information

This information must be protected using appropriate security and access-control mechanisms.

14.5 Explainability

Some advanced machine-learning approaches may produce recommendations without clearly explaining why a particular job or candidate was recommended.

For recruitment, explainability is particularly important because students and recruiters may need to understand the basis of a recommendation.

14.6 Dynamic Skill Requirements

Industry requirements change continuously. A student who qualifies for a role today may need different skills for a similar role in the future.

Therefore, a placement portal should support continuously updated job and skill information.

15. Research Gap

Based on the reviewed literature, the following research gaps can be identified.

Research Gap 1 – Lack of Complete End-to-End Integration

Many studies focus on a particular component such as:

- Job recommendation
- Placement prediction
- Resume screening
- Candidate matching

There is an opportunity to integrate these capabilities into a single campus recruitment platform covering the complete workflow from **student registration to final placement**.

Research Gap 2 – Dynamic Industry Skill Matching

Existing approaches often rely on historical information. There is a need for systems that continuously update job requirements and industry skills.

A modern portal could allow recruiters or placement officers to update skill requirements dynamically.

Research Gap 3 – Explainable Recommendations

Advanced ML models can provide powerful predictions but may not clearly explain their recommendations.

A useful research direction is to provide explanations such as:

“This job was recommended because the student has Python, SQL, and Machine Learning skills and satisfies the required CGPA.”

Research Gap 4 – Fair and Responsible Recruitment

AI-based recruitment systems require mechanisms to detect and reduce unfair bias.

The system should avoid making decisions based on inappropriate personal attributes and should provide human oversight for important recruitment decisions.

Research Gap 5 – Cold-Start Handling

New students and newly posted jobs may not have historical interaction information.

A hybrid approach combining:

Profile Matching + Content-Based Filtering + Skill Similarity + Historical Data

could reduce the cold-start problem.

Research Gap 6 – Human-in-the-Loop Recruitment

Complete automation is not necessarily appropriate for recruitment.

A better system can provide recommendations to placement officers and recruiters while keeping the final decision with authorized humans.

Recent research on candidate recommendation also highlights the importance of considering the development and deployment of recommendation systems in real-world recruitment environments rather than treating recommendation purely as an ML problem.

16. Proposed Improved System

Based on the research gaps, the proposed **Campus Placements and Recruitment Portal** can integrate the following components:

The system can combine conventional portal functionality with intelligent recommendation capabilities.

Evolution of Intelligent Campus Recruitment Systems

17. Proposed Architecture Based on Research Gaps

The proposed system can consist of the following layers:

Presentation Layer

- Student portal
- Recruiter portal
- Placement officer dashboard

Application Layer

- Authentication
- Profile management
- Job management
- Application management
- Interview management

Intelligence Layer

- Eligibility engine
- Resume analysis
- Skill extraction
- Job recommendation
- Candidate matching
- Career recommendation

Data Layer

- Student database
- Recruiter database
- Job database
- Application database
- Placement history

Analytics Layer

- Placement statistics
- Skill-gap analysis
- Recruitment trends
- Recommendation analytics

18. Future Research Directions

Based on the identified gaps, future development can focus on the following areas.

18.1 Explainable AI

Future systems can explain why a student is recommended for a particular job.

18.2 NLP-Based Resume Analysis

NLP can extract:

- Programming languages
- Technical skills
- Certifications
- Projects
- Education
- Experience

from student resumes.

18.3 Dynamic Skill Graph

A continuously updated skill graph can connect:

Skill → Job Role → Company → Industry → Career Path

This can help students identify missing skills.

18.4 Personalized Career Recommendations

Instead of simply recommending available jobs, the system could recommend:

- Job roles
- Skills to learn
- Certifications
- Companies

- Career paths

18.5 Fairness-Aware Recruitment

Future systems should evaluate recommendations for potential bias and provide appropriate human oversight.

18.6 Real-Time Industry Updates

Recruiters and placement officers could update skill requirements, job descriptions, salary ranges, eligibility criteria, and recruitment schedules.

18.7 Human-in-the-Loop Decision Making

AI should assist recruiters and placement officers rather than completely replacing human decisions.

19. Relevance to Campus Placements and Recruitment Portal

The literature survey directly supports the proposed system.

The reviewed studies demonstrate that modern recruitment platforms can move beyond simple job listings toward intelligent matching and recommendation.

For the proposed portal, the following features can be derived from the literature:

Research Finding	Proposed Portal Feature
Student profiling	Student skill/academic profile
Similarity recommendation	Job matching
Neural embeddings	Advanced job representation
Semantic matching	Resume-job matching
ML prediction	Placement prediction
Dynamic recommendation	Updated job recommendations
NLP	Resume analysis
Candidate filtering	Recruiter shortlisting assistance
Knowledge graphs	Career and skill relationships
Explainable AI	Reason for recommendation
Human-in-the-loop	Recruiter/placement officer approval

20. Overall Research Gap Summary

The literature demonstrates substantial progress in intelligent job recommendation and campus recruitment. However, there remains an opportunity to develop a **unified, explainable, secure, dynamic, and human-supervised campus recruitment platform**.

The proposed system should combine traditional placement portal functionality with intelligent features while addressing the limitations identified in previous research.

The key objective is therefore not simply to automate recruitment, but to create a system that is:

Intelligent + Personalized + Explainable + Secure + Fair + Human-Supervised + Adaptable

21. Conclusion

The literature survey shows that campus recruitment is increasingly moving from traditional manual processes toward intelligent, data-driven systems. Existing research has investigated student profiling, similarity-based recommendation, neural embeddings, semantic matching, machine learning, dynamic recommendation, NLP-based resume analysis, AI-assisted candidate filtering, and knowledge-graph-based career recommendation.

However, several challenges remain, including **cold-start problems, dependence on historical data, algorithmic bias, privacy concerns, lack of explainability, changing industry requirements, and limited end-to-end integration.**

Therefore, the proposed Campus Placements and Recruitment Portal can address these gaps by integrating eligibility verification, resume analysis, skill matching, personalized job recommendations, explainable AI, dynamic industry-skill updates, recruiter assistance, and human-in-the-loop decision-making.

Such a system can provide a more efficient and responsible approach to campus recruitment while helping students identify suitable career opportunities and helping recruiters find candidates whose skills and qualifications align with their requirements.

Rubrics for Calculation

Evaluation Criteria	Excellent (4 Marks)	Good (3 Marks)	Satisfactory (2 Marks)	Needs Improvement (1 Mark)
Selection & Review of Research Papers(25%)	Selects highly relevant, recent, credible papers and provides comprehensive reviews of objectives, methodology, tools, datasets, and findings	Selects relevant papers and provides good reviews with minor gaps	Selects moderately relevant papers with basic reviews	Papers are irrelevant or reviews are incomplete
Comparative Analysis(20%)	Provides a detailed comparison of methodologies, tools, datasets, results, and performance using a clear comparison table	Provides a good comparison with relevant parameters	Provides limited comparison with few parameters	Little or no meaningful comparison
Critical Analysis & Research Gap(25%)	Clearly analyzes limitations and identifies significant, well-supported research gaps	Identifies relevant limitations and research gaps	Identifies basic gaps with limited analysis	Research gaps are unclear or missing
Future Directions & Relevance(15 %)	Proposes practical and innovative future directions directly relevant to the assigned problem statement	Proposes relevant future directions	Provides general future suggestions	Future directions are missing or unrelated
Documentation , Citations & References(15 %)	Excellent academic structure, clear presentation, accurate citations, and consistent referencing	Well-organized with minor formatting/citation issues	Adequately documented with some errors	Poorly organized with inadequate or incorrect references

Criteria	Mark
Selection & Review of Research Papers(25%)	/5
Comparative Analysis(20%)	/5
Critical Analysis & Research Gap(25%)	/5
Future Directions & Relevance(15%)	/5
Documentation, Citations & References(15%)	/5
